

AR Statement Template

Standard Operating Procedure — User Guide | Version 2.0 | May 2026

Overview

This template automates the cleanup and formatting of monthly Accounts Receivable statements exported from Oracle ERP. Once you paste raw data and click Export & Clear Data, the template handles column cleanup, currency formatting, color coding, summary calculations, file export, folder sorting, and data refresh automatically. A full tracking system lets you manage which accounts have been sent, which have no invoices due, and which still need processing — all in one place.

Template Tabs

- Instructions — this guide. Reference it any time.
- Raw Data — paste your raw Oracle export here for each account. Headers must be in row 1.
- Clean Statement — main working tab. Contains formatted output, summary boxes, tracking buttons, and the unsent accounts list in columns N through Q.
- Claims — displays Claim Investigation rows separately. Only exports with the statement if claims exist.
- Statements Email List — master list of all accounts with customer names, account numbers, POC contacts, and email addresses.

Button Guide

- Export & Clear Data (top left) — exports the statement to OneDrive _Inbox, marks the row green, refreshes the unsent list, clears Raw Data, and refreshes Power Query. This is your primary button.
- Sort Statements (top right) — moves exported files from _Inbox into the correct account subfolders automatically.
- Email Statements (next to Monthly Summary) — opens Outlook email drafts addressed to the correct customer with the statement attached.
- No Invoices Due (bottom right) — marks the account grey. No file is created.
- Reset Statements (bottom left) — clears all green and grey colors at the start of each month.

First-Time Setup — Enable Macros

When you open the template, Excel will show a yellow security bar saying Macros have been disabled. Click Enable Content for the buttons to work. This is a one-time click per session and is completely safe.

Step-by-Step Workflow

1. Open the template by double-clicking the file. A fresh unsaved copy opens automatically.
2. Click Enable Content in the yellow bar at the top if it appears.
3. Click the Raw Data tab and paste your Oracle statement export starting at cell A1. Make sure the header row is included.
4. Click the Clean Statement tab and click Export & Clear Data. Enter the account number when prompted.
5. If an account has no invoices due, click No Invoices Due instead. No file is created — the row is marked grey.
6. Repeat steps 3 through 5 for each account.
7. Click Email Statements to open Outlook drafts. Review and send each one.
8. Click Sort Statements to automatically file all exported statements into account folders.
9. At the start of next month, click Reset Statements to clear all colors and start fresh.

Understanding the Clean Statement Tab

After refreshing, your statement will contain these columns: Document Type, Document Number,

All date-based formulas use TODAY() which detects the current date every time the file opens or refreshes. April statements calculate April totals, May statements calculate May totals — all automatically with no manual updates needed.

Summary Formula Explanations

All summary formulas use SUMPRODUCT which checks multiple conditions per row and adds up only rows where all conditions are true. Formulas use table column references like Table[Amount Due] instead of fixed cell addresses so they never shift when new data loads.

- Due thru EOM — Adds up positive invoices due in the current month/year where Days Late is zero or negative. Prevents overdue invoices from being double-counted in both Due thru EOM and Past Due.
- Past Due — Adds up positive invoice amounts where Days Late is greater than zero. Credits are excluded automatically because negative amounts fail the positive amount condition.
- Total Credits — Adds up all negative amounts in Amount Due using SUMIF — only one condition needed.
- Net Balance — Adds Due thru EOM + Past Due + Total Credits. Because Total Credits is negative it automatically reduces the total.
- Due by 10th / 20th / EOM — Same logic as Due thru EOM but filters by day number. Total Due is the sum of all three buckets.
- Claims Summary — Uses SUMIF to total positive (Claims Owed) and negative (Claims Credits) amounts on the Claims tab independently. Never affects Clean Statement totals.
